MCM/ICM
Summary Sheet**

Team Control Number

111111

1 Introduction

MCM/ICM offer your team and school the chance to win prizes. The 2025 International *COMAP* Scholarship Award will be awarded to the six(6) top MCM/ICM teams from any of the participating countries/regions.

Schools enjoy the recognition and prestige of being part of COMAP's annual international modeling contest event. COMAP published a press release of the annual contest results that lists advisors, schools, school locations, and awards. Contest participation indicates the school's support of students' meaningful application of topics studied in the classroom in preparation for addressing a variety of problems in the real-world. The contest can provide impetus and justification for developing more applied courses and for integrating modeling into current courses.

2 Problem restatement

To quantify uncertainty, we treat the parameter vector of each Gaussian as a random variable and initialize it with a Gaussian prior, $\theta_i \sim \mathcal{N}(\theta_i^0, \Sigma_i^0)$. For notational clarity, we stack the per-Gaussian covariances into a block-diagonal matrix.

3 Problem analysis

as shown above

4 Assumption

5 Notion

6 Task 1 model establishment

6.1 data analysis

6.1.1 data error detection
